Da Vinci Good Practice

Reference Usage

To improve consistency and interoperability while using References within the HReX or broader Da Vinci implementations, it is recommended to use the Reference data type profile (with following constraints):

- **Mandatory Fields**: Ensure Reference.reference and Reference.identifier are consistently populated.
- **Must-Support**: Reference.display marked as must-support to enhance interpretability and user experience.

Although current constraints on Reference will not be tightened, adherence to the Reference data type profile is advised for uniformity and clarity. While not immediately enforced, these practices may eventually be embedded into tooling via warnings, guiding implementers towards maintaining coherence and standardization in their data exchange mechanisms within the HReX and Da Vinci ecosystems.
