Inventory checking

The checking of inventory is not a common clinical focus but it has implications - operational and clinical. For example, Availability of medication may influence the decision of encoding and dispensing (e.g. dispense drug A, not drug B because inventory is insufficient)

The focus on availability of devices and equipment has also raised the interest in inventory checking.

Initial draft for discussion of how a Inventory resource could look like (click to edit diagram on server - if you do, please update the diagram here):
